## System of Radiological Protection, ICRP

# The International Commission on Radiological Protection (ICRP) - Mission

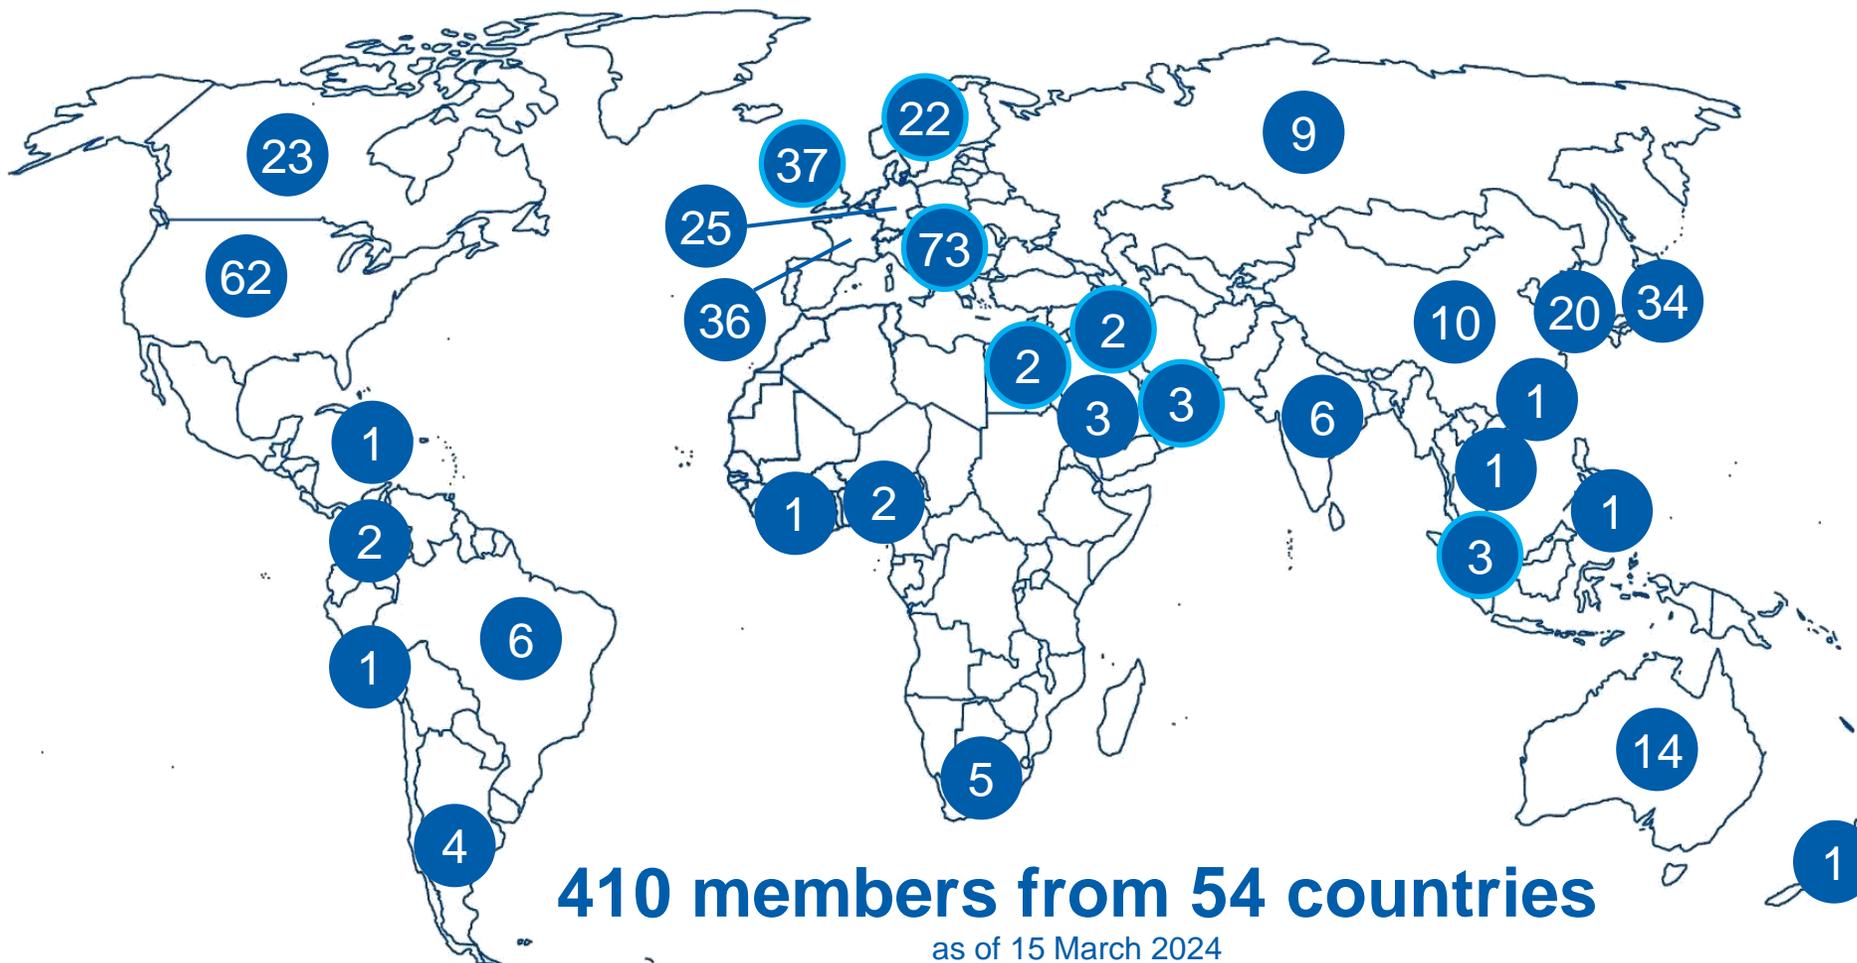

## Our Mission

- **Protecting patients, workers, the public, and the environment against detrimental effects of radiation exposure world-wide (and beyond!) ...**
- **... without unduly limiting the benefits associated with the use of ionizing radiation.**

The **recommendations** developed by ICRP are the basis of **standards, regulations, guidance,** and **practice ... everywhere**

# The International Commission on Radiological Protection (ICRP)

- Members are selected based on their expertise
- Members do not represent their country
- Members do not represent their employer

# ICRP Structure

# ICRP Main Commission

**Werner Rühm**

Chair

**Simon Bouffler**

Vice-Chair

**Christopher Clement**

Scientific Secretary

**Dominique Laurier**

C1 Chair

**François Bochud**

C2 Chair

**Kimberly Applegate**

C3 Chair

**Thierry Schneider**

C4 Chair

**Kun-Woo Cho**

Member

**Gillian Hirth**

Member

**Michiaki Kai**

Member

**Senlin Liu**

Member

**Sergey Romanov**

Member

**Andrzej Wojcik**

Member

# ICRP Committees

## Committee 1 Effects

considers the effects of radiation action from the subcellular to population and ecosystem levels, including the induction of cancer, hereditary, and other diseases, impairment of tissue/organ function and developmental defects, and assesses implications for protection of people and the environment

**Chair: Dominique Laurier, France**

## Committee 2 Doses

develops dosimetric methodology for the assessment of internal and external radiation exposures, including reference biokinetic and dosimetric models and reference data and dose coefficients, for use in the protection of people and the environment

**Chair: François Bochud, Switzerland**

## Committee 3 RP in Medicine

addresses protection of persons and unborn children when ionising radiation is used in medical diagnosis, therapy, and biomedical research, as well as protection in veterinary medicine

**Chair: Kimberly Applegate, USA**

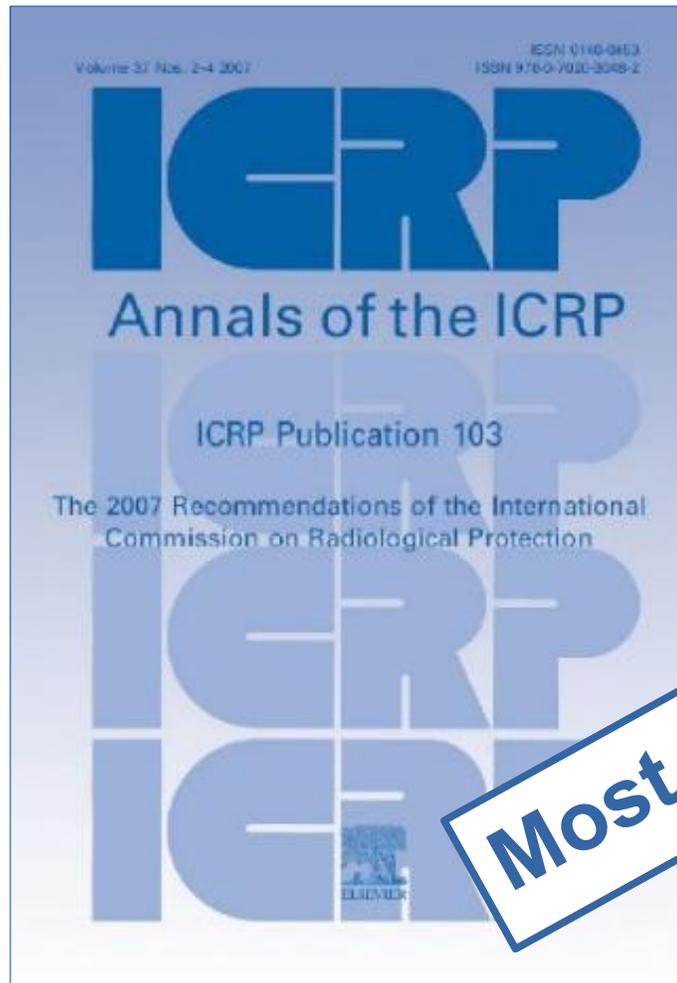

## Committee 4 Application

provides advice on the application of the Commission's recommendations for the protection of people and the environment in an integrated manner for all exposure situations

**Chair: Thierry Schneider, France**

# ICRP Publications

- **General Recommendations** (most recent 2007)
- **Publications on specific aspects of radiological protection**, e.g., deep sea disposal
- **Publications on the tools needed to implement radiological protection**, e.g., dose coefficients
- **Publications that assess impacts of new scientific findings**, e.g., cancer risks from uranium

**Most of them are available at no cost!**

# 31 Active ICRP Task Groups

TG36	Radiopharmaceutical Doses	TG114	Reasonableness and Tolerability
TG91	Low-dose and Low-dose Rate Exposure	TG115	Risk and Dose for Astronauts
TG95	Internal Dose Coefficients		Imaging for Radiotherapy
TG96	Computational Phantoms and RP		PET/CT
TG97	Surface and Near Surface		$W_R$
TG98	Contaminated Sites		the Circulatory System
TG99	Reference Animals and Plants in		on Emergencies and Malicious Events
TG103	Mesh-type Computational Phantoms	TG121	Offspring and Next Generations
TG105	The Environment in the System of RP	TG122	Detriment Calculation for Cancer
TG106	Mobile High Activity Sources		Classification Radiation-induced Effects
TG108	Optimisation in Medical Imaging		Principle of Justification
TG109	Ethics in RP in Medicine		Services
TG111	Individual Response to Radiation		Biomedical Research
TG112	Emergency Dosimetry		Exposure Situations and Categories
TG113	Dose Coefficients for X-ray Imaging	TG128	Individualisation & Stratification
		TG129	Ethics in the practice of Radiological Protection

**New Task Groups  
announced on the  
ICRP website**

**Membership  
identified through  
Open Calls**

# ICRP Mentorship Programme

- Engagement of university students, early-career professionals, scientists in ICRP Task Groups
- Mentees may come from educational, governmental, private, other organisations
- Assignment of specific roles or tasks
- Mentor is responsible for providing guidance and support to the mentee

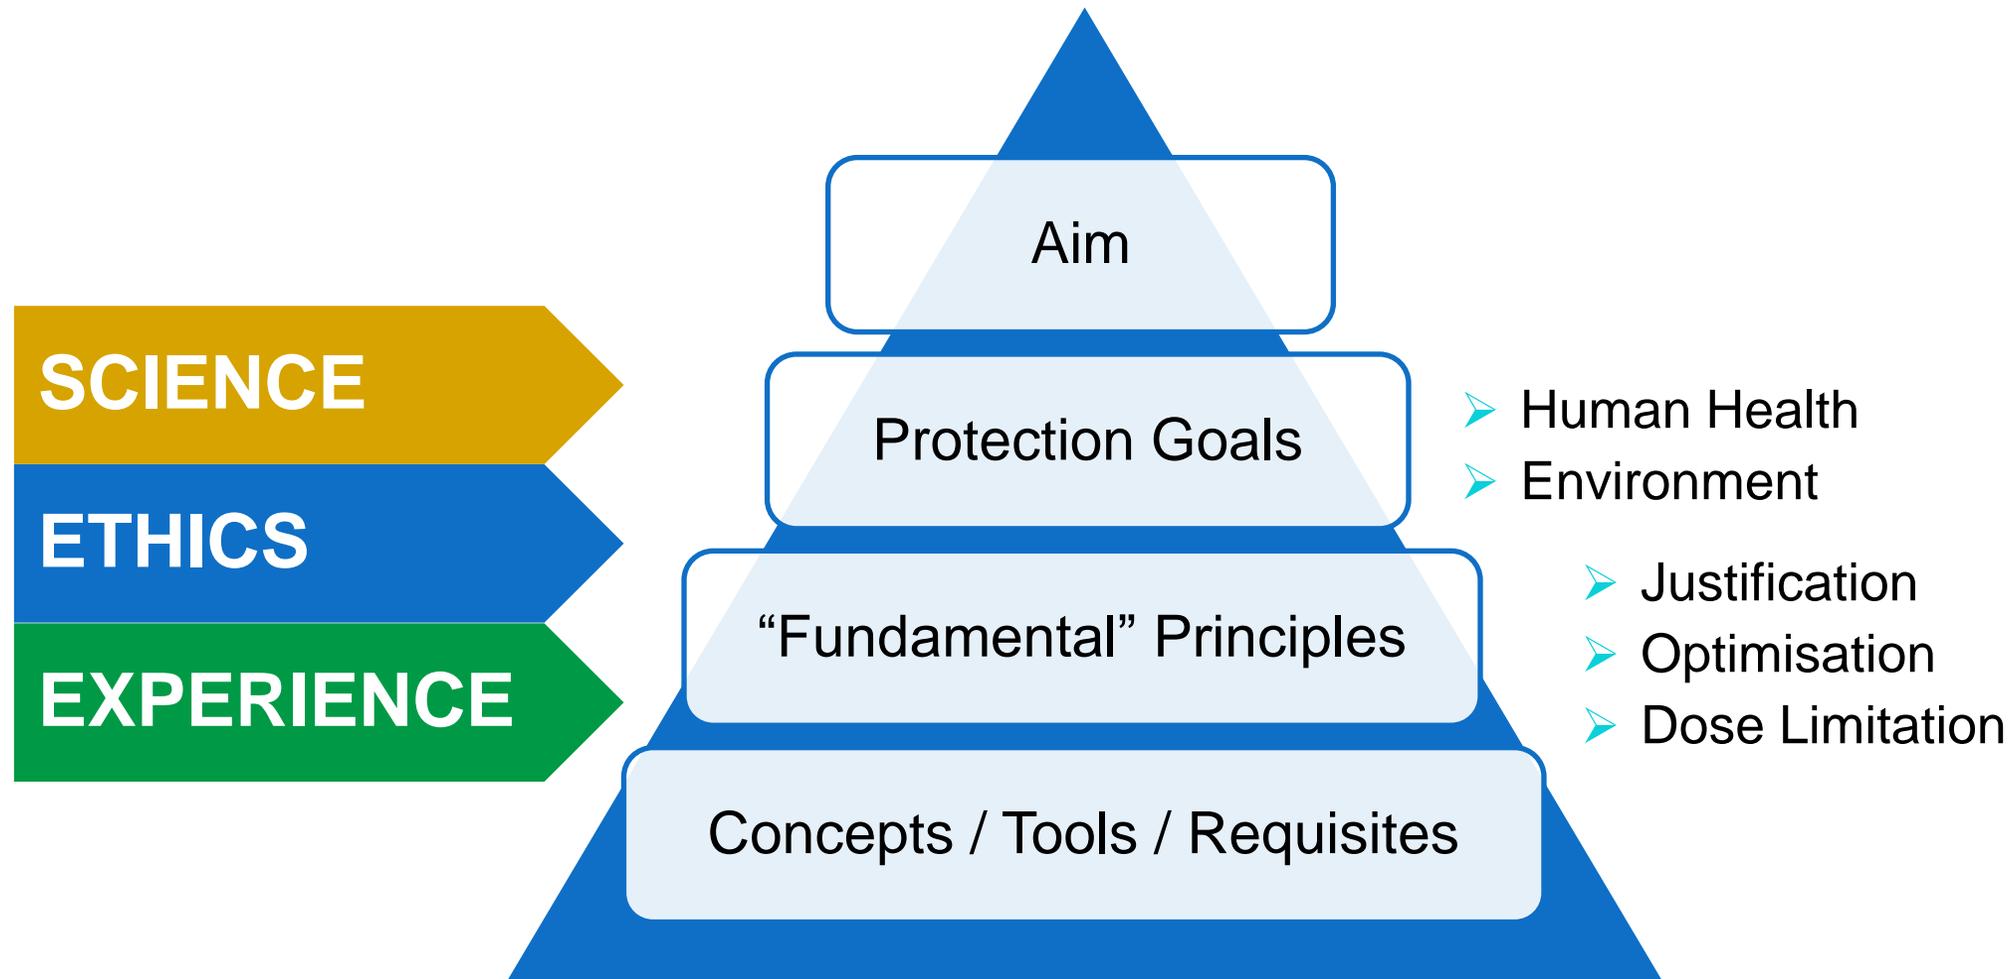

Task Group	Mentor	Task(s), Role	Application Deadline
<p><a href="#">Task Group 126</a></p> <p>Radiological Protection in Human Biomedical Research</p>	TBD	<p>Task Group 126 is seeking mentees from ICRP Task Groups 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000</p>	27 October 2023

**Currently 61 ICRP mentees!**

# International Relationship: 35 Organisations in Formal Relations with ICRP (SLOs)

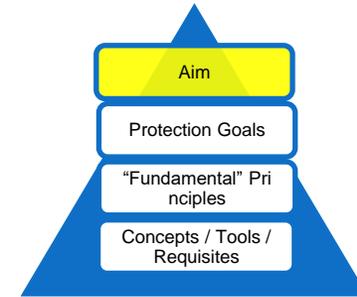

- Conference of Radiation Control Program Directors (CRCPD)
- European ALARA Network (EAN)
- European Alliance for Medical RP Research (EURAMED)
- European Association of National Metrology Institutes (EURAMET)
- European Association of Nuclear Medicine (EANM)

# The System of Radiological Protection

# Primary Aim

Contribute to an appropriate level of protection for people and the environment against the detrimental effects of radiation exposure without unduly limiting the desirable human actions that may be associated with such exposure

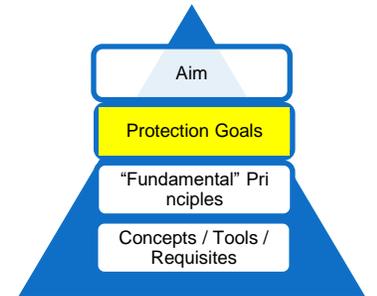

# Protection Goals

**Human Health** - Manage and control exposures so that:

- Harmful **tissue reactions** (deterministic effects) are prevented
- The risks of **stochastic effects** (cancer, heritable effects) are **reduced to the extent reasonably achievable**

**Environment** - Prevent or reduce the frequency of deleterious radiation effects to have a negligible impact on:

- the maintenance of **biological diversity**
- the **conservation of species**
- the health and status of natural **habitats, communities and ecosystems**

# Fundamental Principles

## Justification

Do more good than harm

Beneficence / Non-maleficence

## Optimisation of Protection

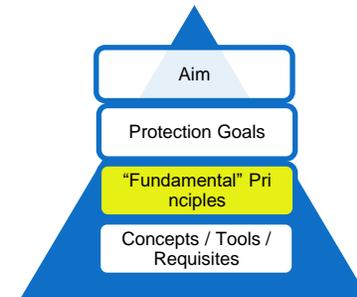

Keep likelihood of exposures, number of people exposed, and magnitude of individual doses As Low As Reasonably Achievable (ALARA), taking into account economic and societal factors

Prudence

## Individual Dose Limitation

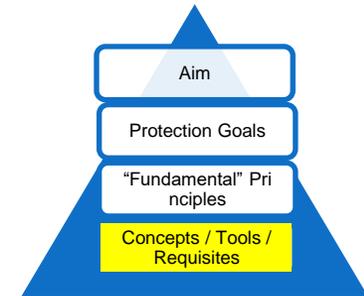

Doses to individuals should not exceed limits  
(for regulated sources in planned exposure situations)

Justice

RP and ethics:  
ICRP Publication 138

# Concepts, Tools, and Requisites

## Exposure situations

Existing  
Planned  
Emergency

## Categories of exposure

Medical  
Occupational  
Public

## Dose criteria

Reference levels  
Dose Constraints  
Limits  
etc.

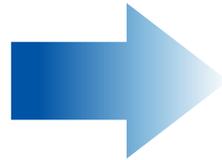

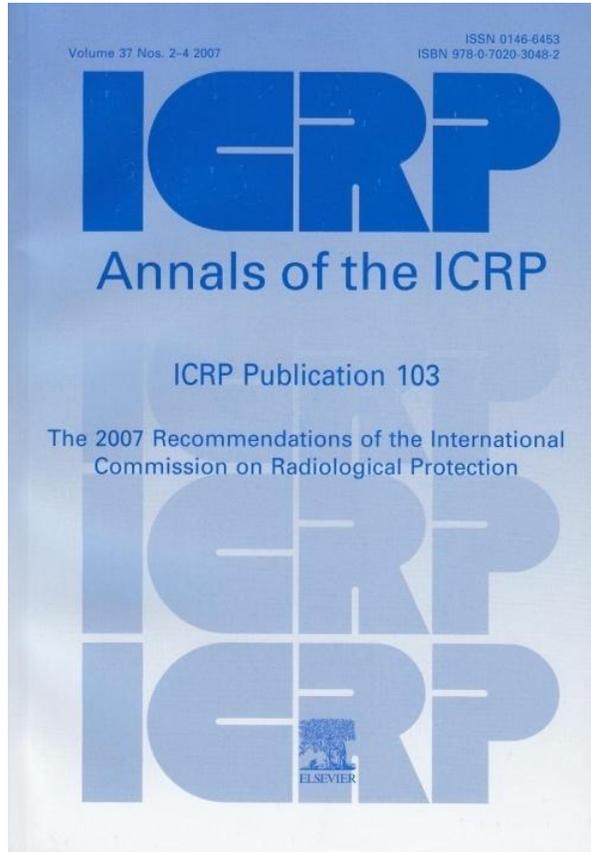

## Key concepts

Dose ( $D$ ,  $H_T$ ,  $E$ )  
Types of Effects  
Representative person  
RAPs  
etc.

## Requisites

Information  
Training  
Monitoring  
etc.

# System Review: Time for Action!

- ICRP Publication 103 forms the basis of radiological protection all over the world
- It is time now to review Publication 103 given **scientific and societal progress** made since 2007
- Identify **basic open questions** (“building blocks”): essential work required for the next general recommendation
- **International collaboration** is key!

# >50 Publications since P103 (selected)

## Fundamental Concepts

- P104 Scope of Control
- P147 Dose Quantities
- P152 Detriment Calculation

## Risk

- P115 Lung Cancer Risk from Rn
- P118 Tissue Reactions
- P150 Plutonium and Uranium

## Dose

- P136 Dose Coeffs for Biota
- P143/145/156 Mesh Phantoms
- ICRU 95 Operational Quantities
- P130/134/137/141/151/158

## Ethics

- P138 Ethical Foundations of RP
- P157 Ethics for RP in Medicine

## Environment

- P108 RAPs
- P114 Transfer Parameters
- P124 Protection of Environment
- P148 Radiation Weighting for RAPs

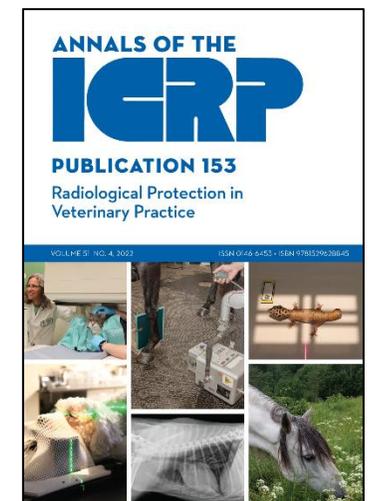

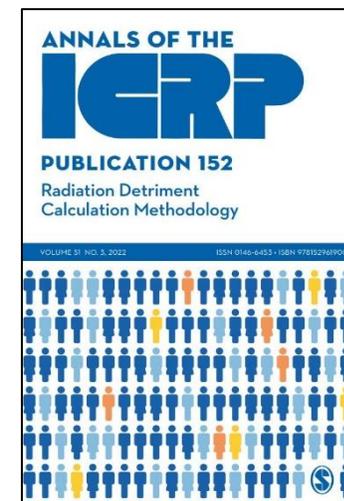

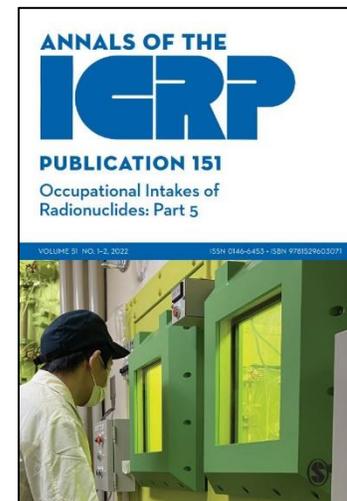

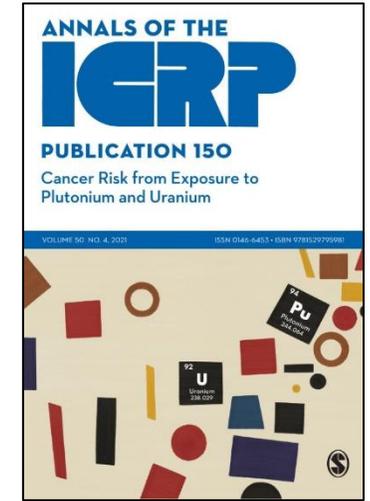

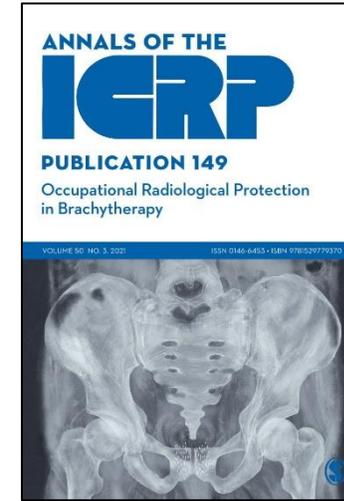

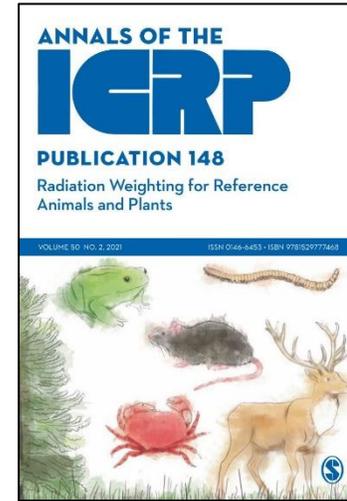

## Exposure Situations

- P122 Geological Disposal
- P126 Radon
- P132 Cosmic Radiation in Aviation
- P142 NORM

## New Domains

- P123 Astronauts
- P153 Veterinary Practice

Many on RP in medicine for diagnosis and treatment (>10)

# Initial Key Milestones (open access papers)

## 1. Keeping the ICRP recommendations fit for purpose

Clement et al 2021 JRP, [www.doi.org/10.1088/1361-6498/ac1611](http://www.doi.org/10.1088/1361-6498/ac1611)

## 2. Areas of research to support the system of radiological protection

Laurier et al 2021 REB, [www.doi.org/10.1007/s00411-021-00947-1](http://www.doi.org/10.1007/s00411-021-00947-1)

## 3. Summary of the 2021 ICRP workshop on the future of radiological protection

Rühm et al 2022 JRP, [www.doi.org/10.1088/1361-6498/ac670e](http://www.doi.org/10.1088/1361-6498/ac670e)

## 4. ... A focus on research priorities - feedback from the international community

Rühm et al 2023 JRP, [www.doi.org/10.1088/1361-6498/acf6ca](http://www.doi.org/10.1088/1361-6498/acf6ca)

Thoughts from  
ICRP & invitation  
to contribute

Summarises  
feedback from  
the community

# Overarching Considerations

**The review & revision process must be inclusive, accessible & transparent**

The System must be based on solid science & ethical values

The System must be easier to communicate & easier to use

Updates must contribute to improved protection

The underlying basis must be robust to handle complex problems and complex scientific, ethical, and practical issues

# ICRP 2025

8<sup>TH</sup> INTERNATIONAL SYMPOSIUM ON THE SYSTEM OF RADIOLOGICAL PROTECTION  
7-9 OCTOBER 2025 • ABU DHABI, UAE

**7-9 October 2025** at the Ritz-Carlton Abu Dhabi, Grand Canal

**Registration and abstract submissions now open**

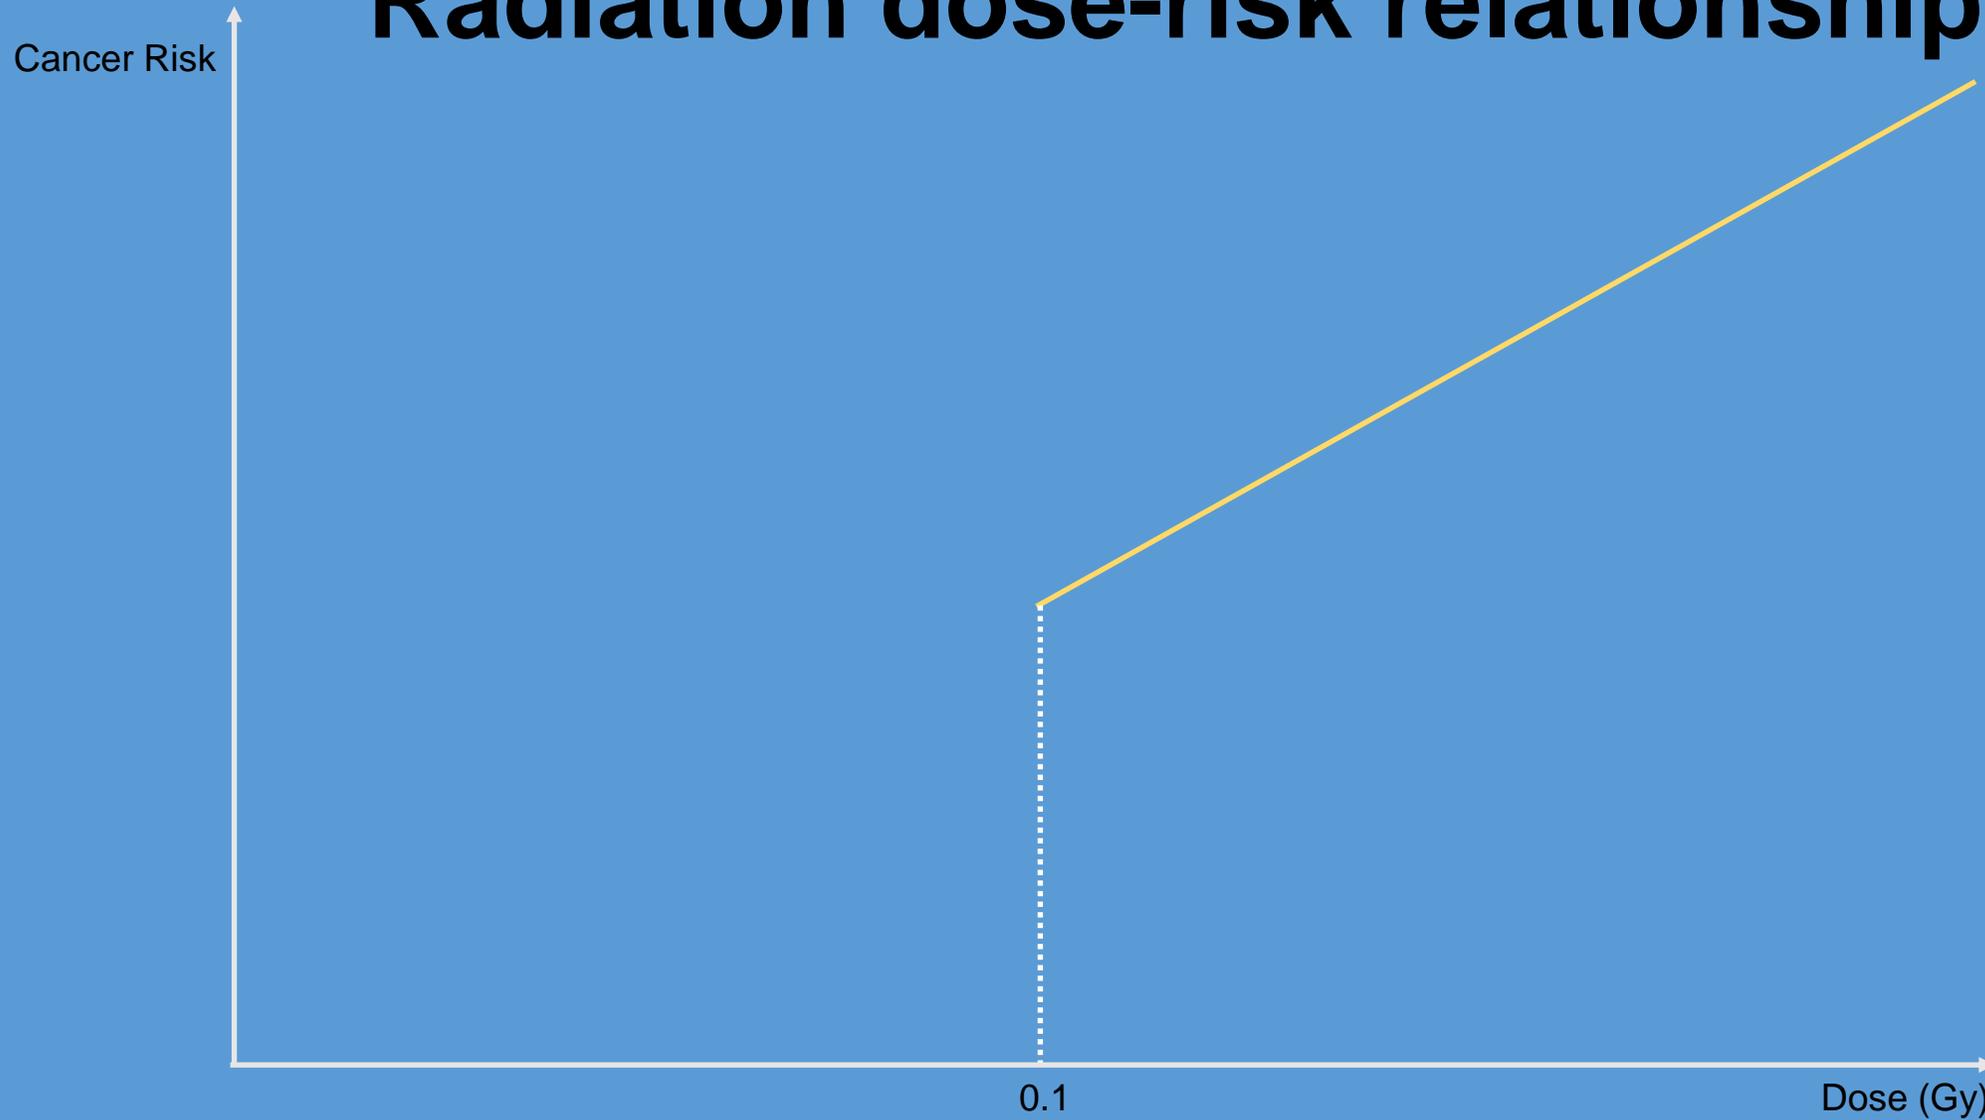

**Interested in exhibition space or sponsorship?** Contact Kelsey Cloutier, ICRP Head of Stakeholder Engagement and Communications ([kelsey.cloutier@icrp.org](mailto:kelsey.cloutier@icrp.org))

# LNT

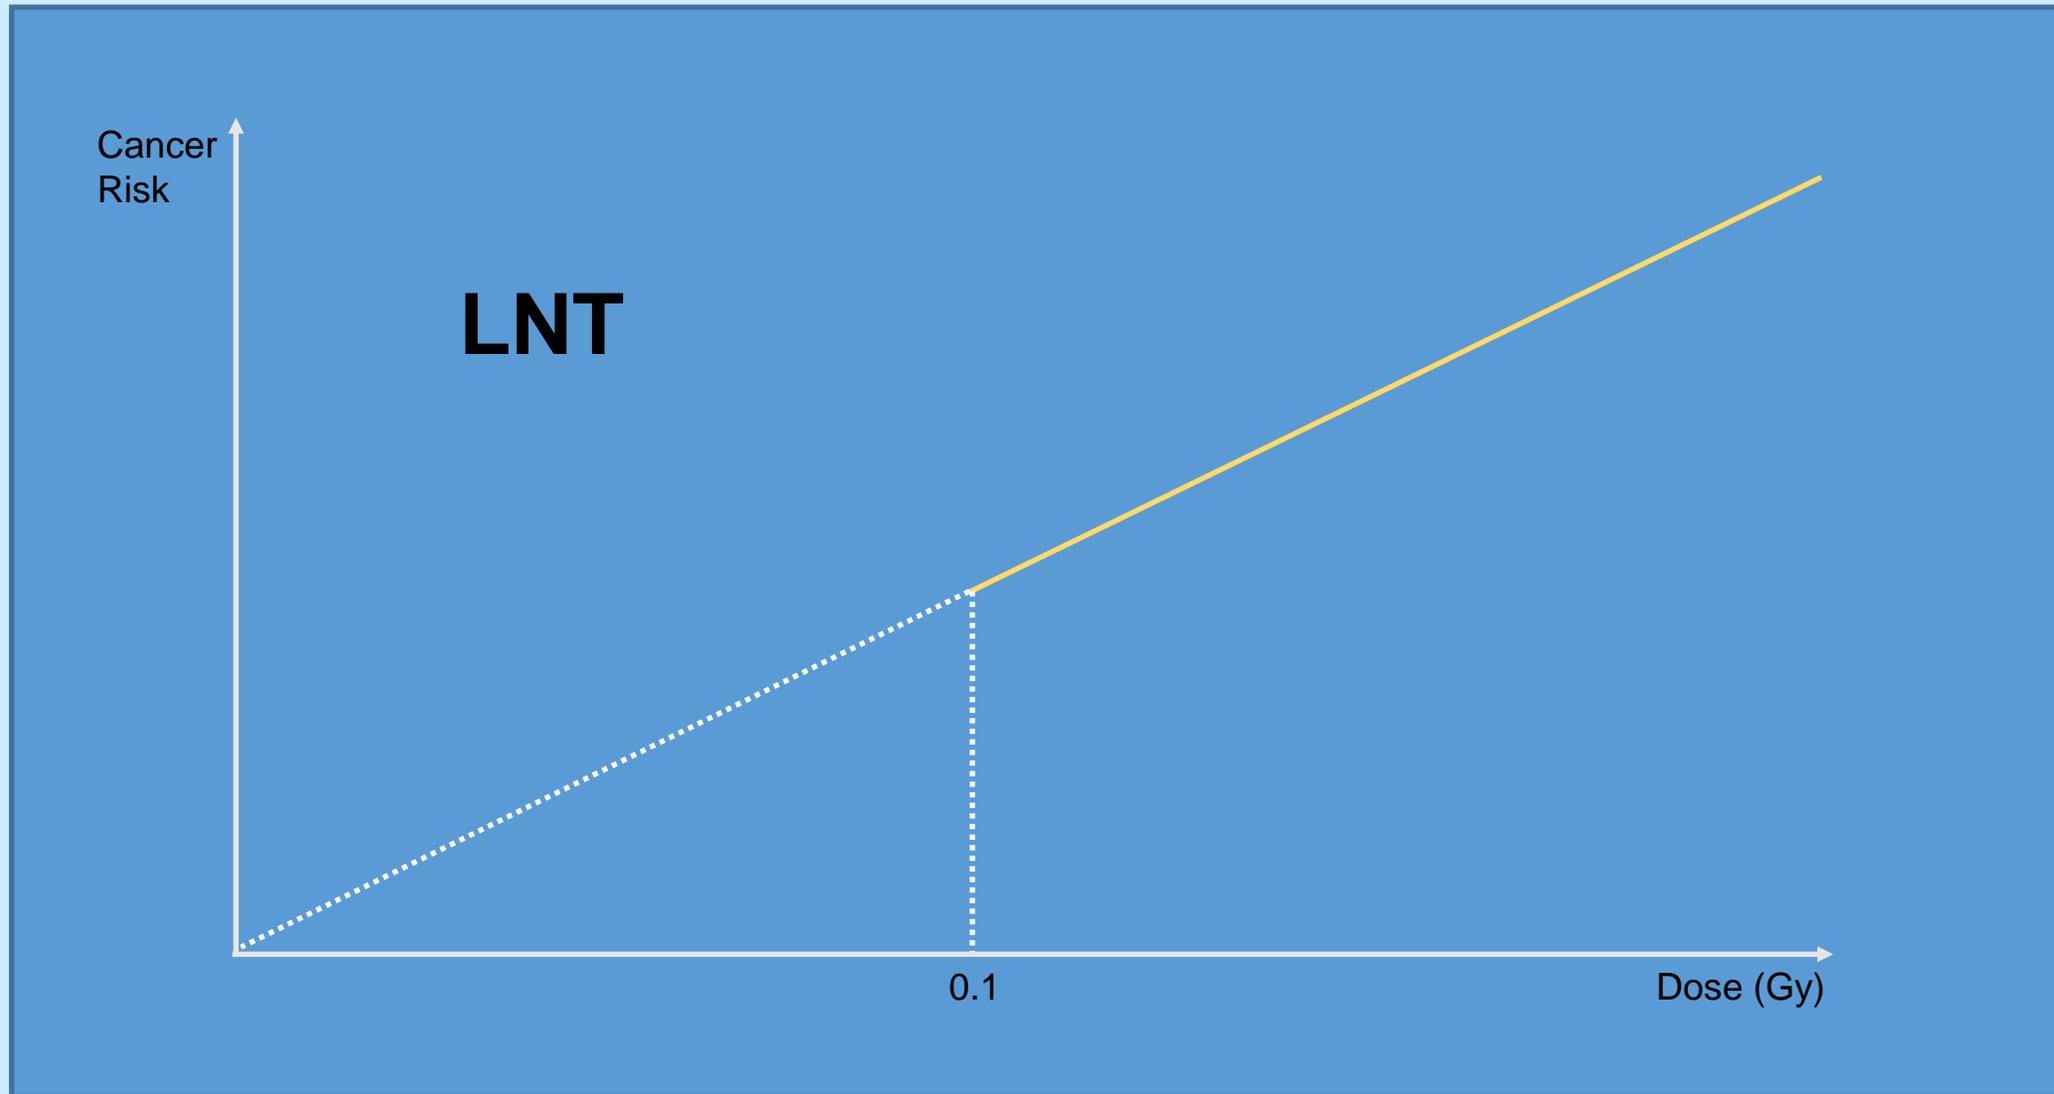

## Linear Non-threshold

### 문턱없는 선형 모델

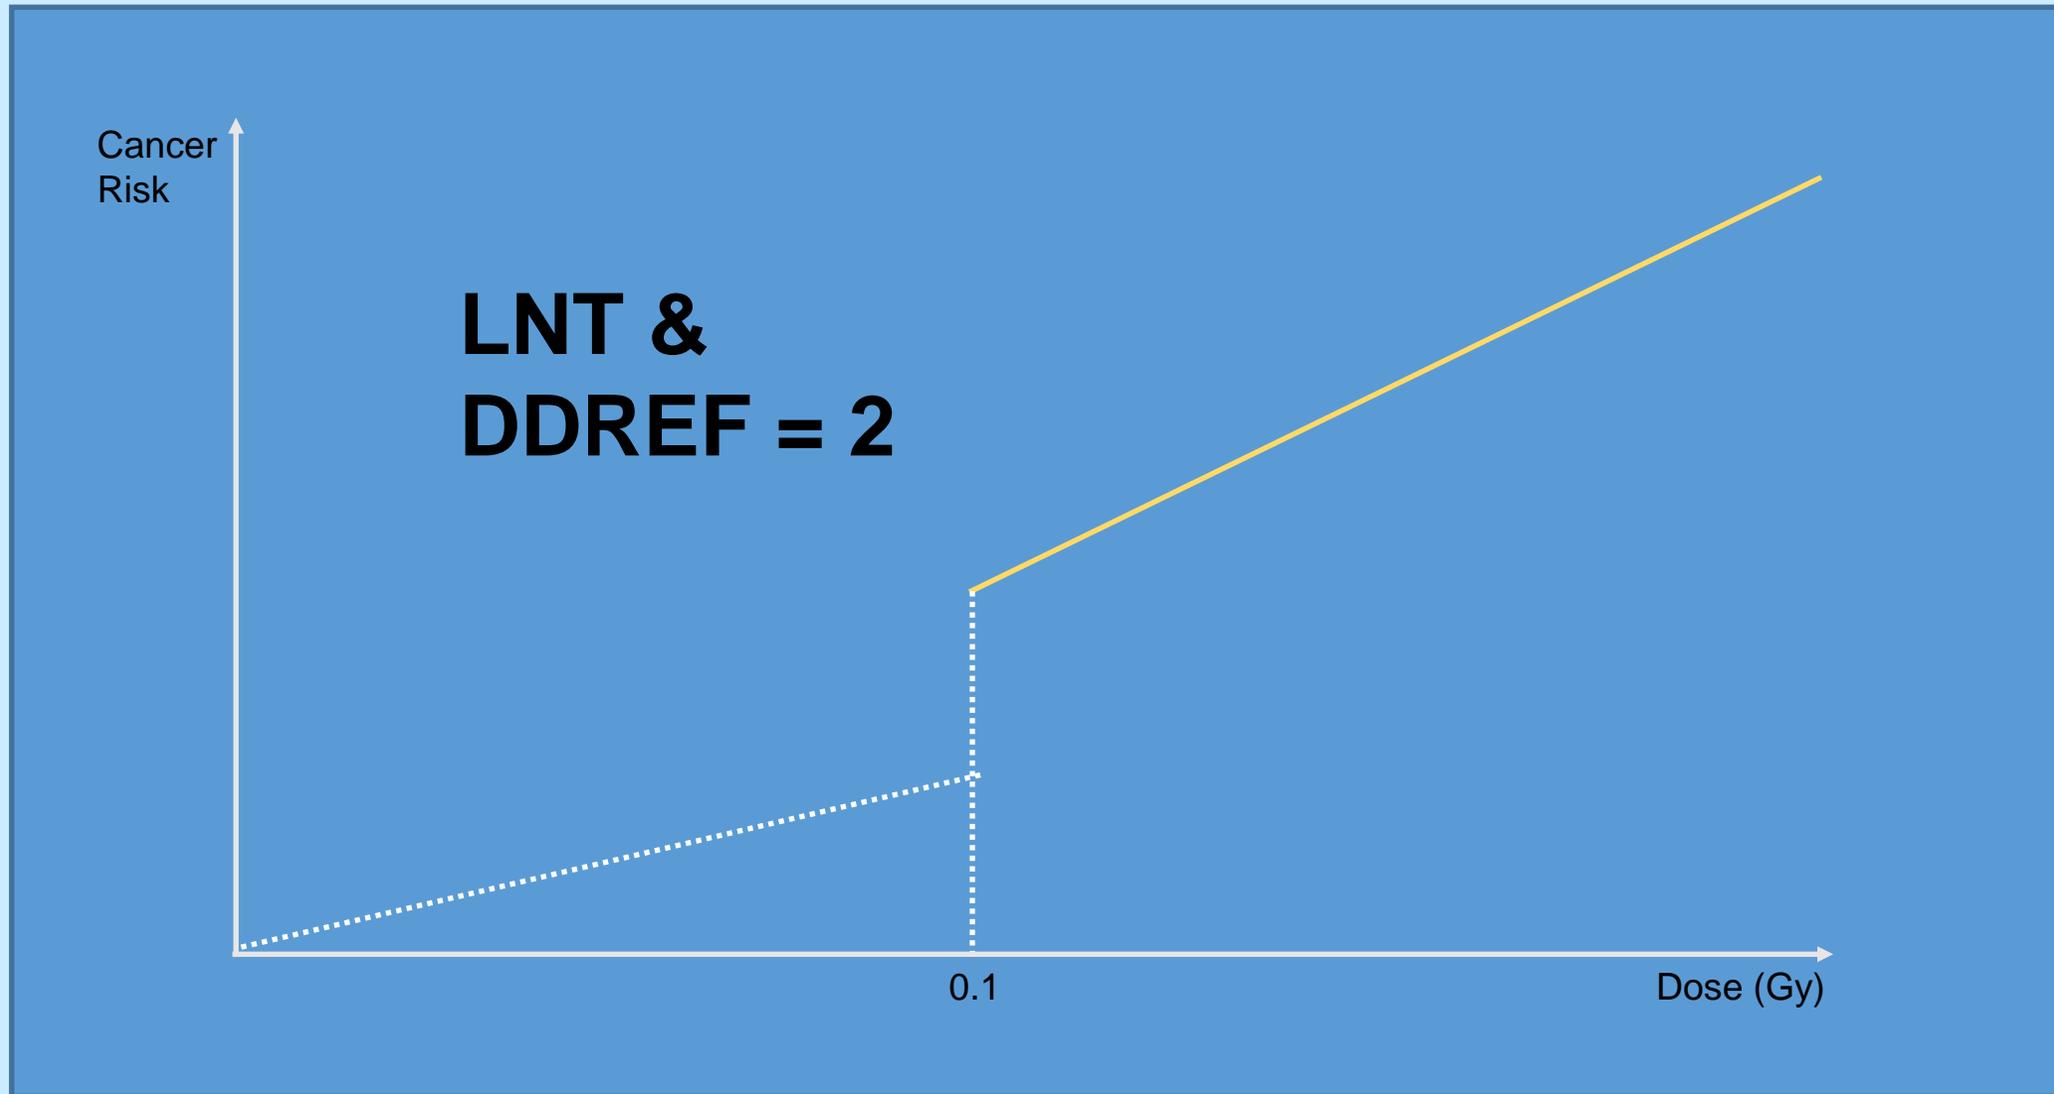

# Radiation dose-risk relationship

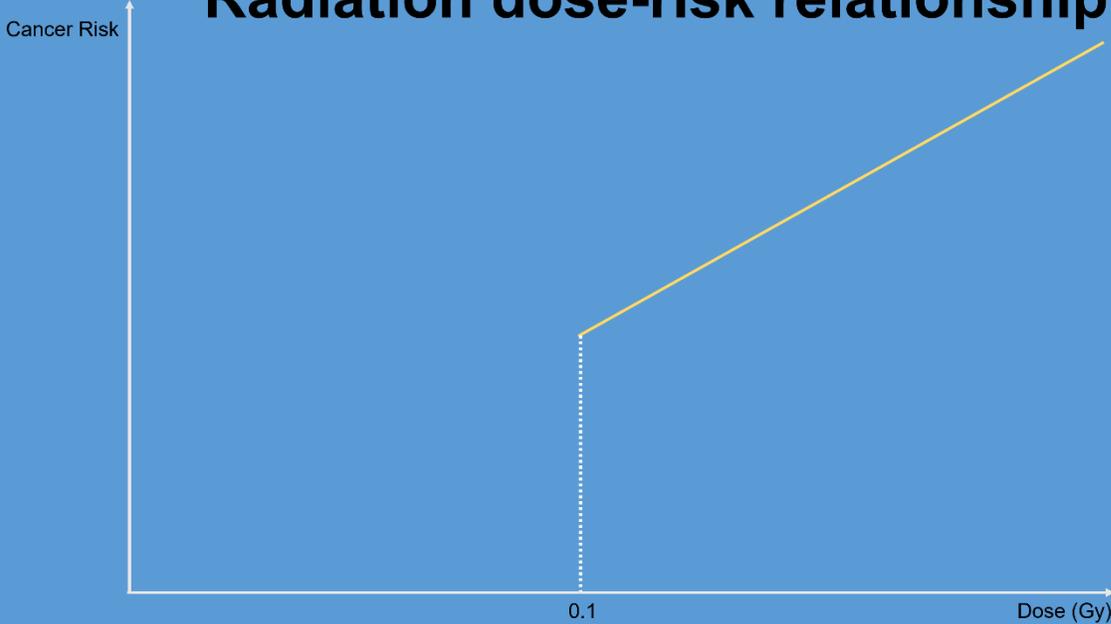

# Radiation dose-risk relationship

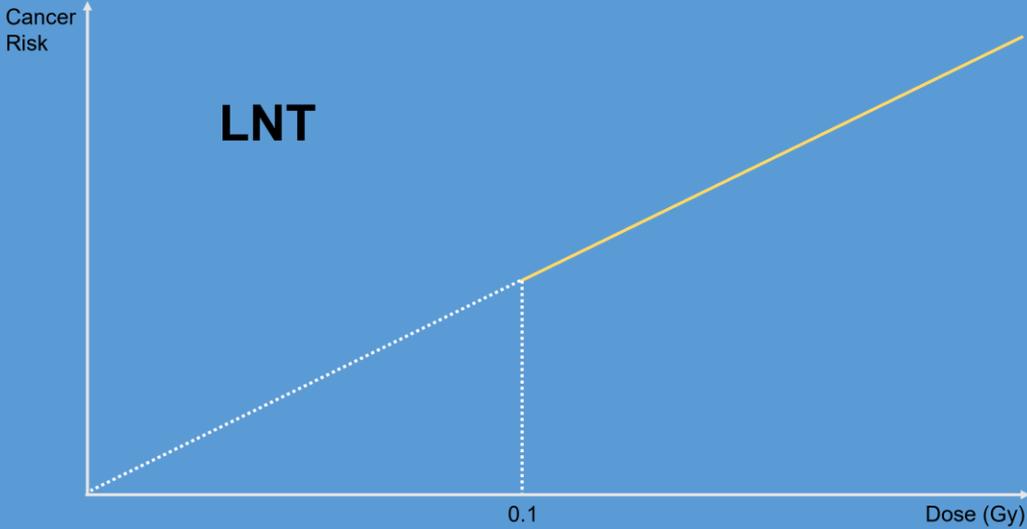

# Radiation dose-risk relationship

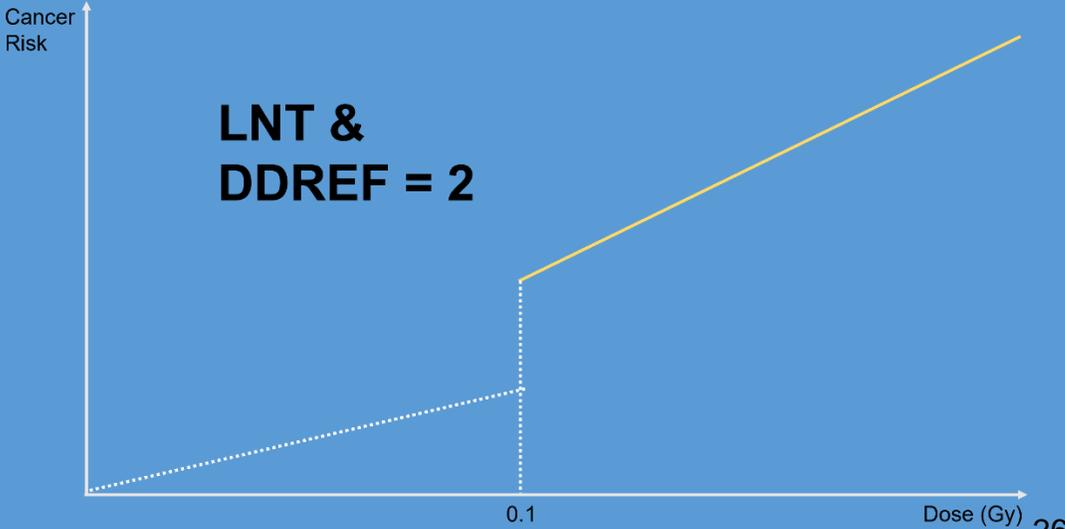

# Radiation dose-risk relationship

**LNT**

**LNT &  
DDREF = 2**

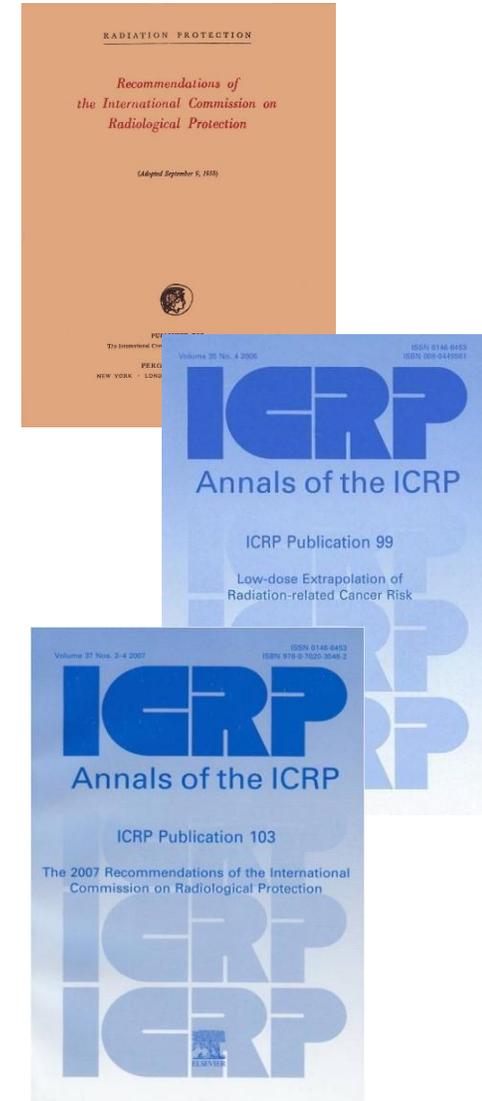

# History of the Linear No-Threshold (LNT) model in ICRP

**Pub 1, 1959:** « On the **assumption that the genetic effects are linearly related to the gonad dose** and **provided that no threshold dose exists**, it is possible to define a population dose average that is relevant to the assessment of genetic injury to the whole population. In the case of **somatic effects** no such dose can easily be defined although the annual per capita dose to certain tissues or to the whole body **may be relevant on the assumption of a non-threshold, linear dose-effect relation** »

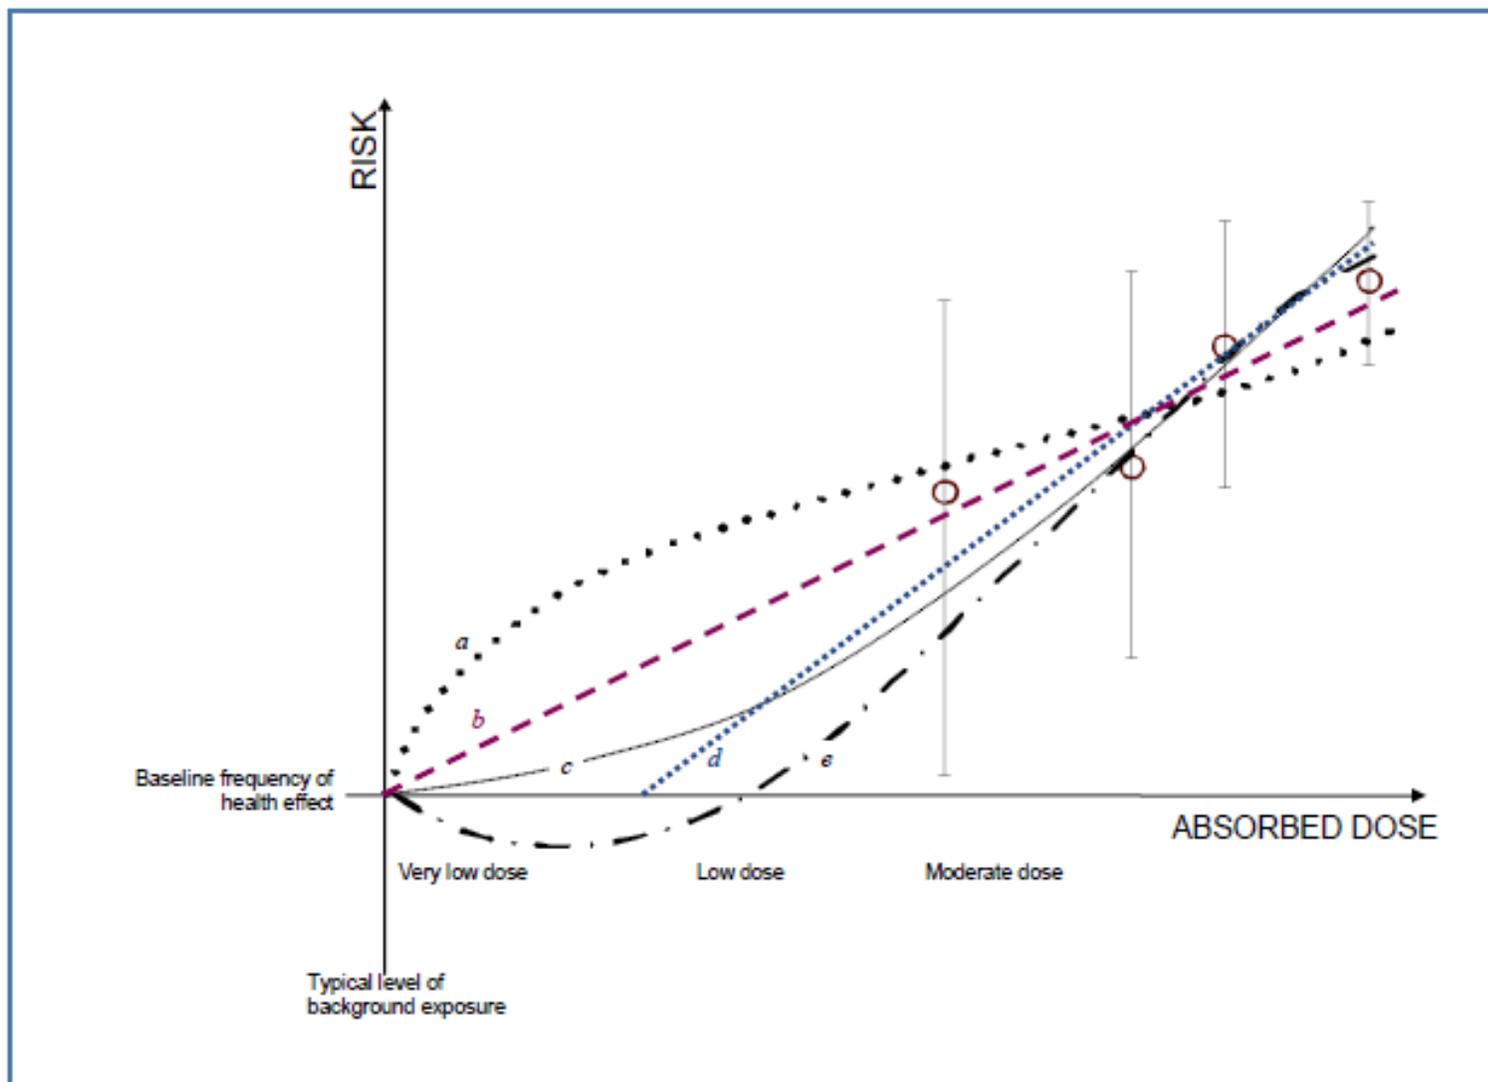

**Pub 99, 2005:** « while existence of a low-dose threshold does not seem to be unlikely for radiation-related cancers of certain tissues, the **evidence does not favour the existence of a universal threshold**. The **LNT hypothesis, combined with an uncertain DDREF** for extrapolation from high doses, remains a prudent basis for radiation protection at low doses and low dose rates”

**Pub 103, 2007:** “...the practical system of radiological protection recommended by the Commission will continue to be based upon the assumption that at doses below about 100 mSv **a given increment in dose will produce a directly proportionate increment in the probability of incurring cancer** or heritable effects attributable to radiation. This dose-response model is generally known as ‘linear-non-threshold’ or **LNT**. ...the Commission considers that the adoption of the LNT model combined with a judged value of a dose and dose rate effectiveness factor (**DDREF**) provides a **prudent basis for the practical purposes of radiological protection**, i.e., the management of risks from low-dose radiation exposure »

# Plausible dose-response relationships for the risk of cancer in the ranges of very low, low and moderate doses

[UNSCEAR report 2012 Annex A (fig 1), 2015]

Doses are in addition to the total background exposure to natural sources of radiation.

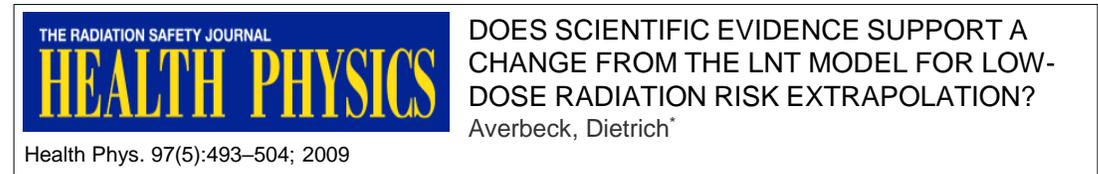

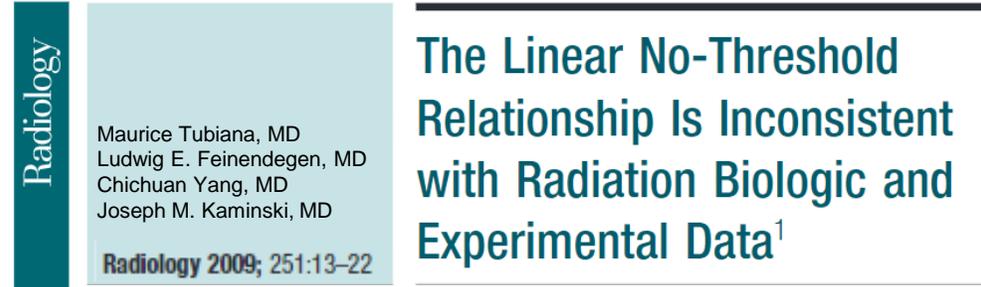

The data points and confidence intervals represent observations of increased frequency of occurrence of a specific cancer type in populations exposed to **moderate doses**.

The various lines represent the following plausible dose-response relationships for inferred risks of cancer for exposures in the range of **low and very low doses**:

- (a) supralinear;
- (b) linear non-threshold (LNT);**
- (c) linear-quadratic;
- (d) threshold and (e) hormetic.

# Criticisms of the LNT model

- Biological: inconsistencies with experimental data
- Epidemiological: uncertainties of data at low doses
- Historical: scientific errors, or even deliberate distortion of results
- Practical: limits the benefits of using ionizing radiation

# Implications of recent epidemiologic studies for the linear-nonthreshold model and radiation protection

## NCRP Commentary n°27, 2018

### Critical review of recent studies (10y)

- 29 studies (occupational, medical, environmental)

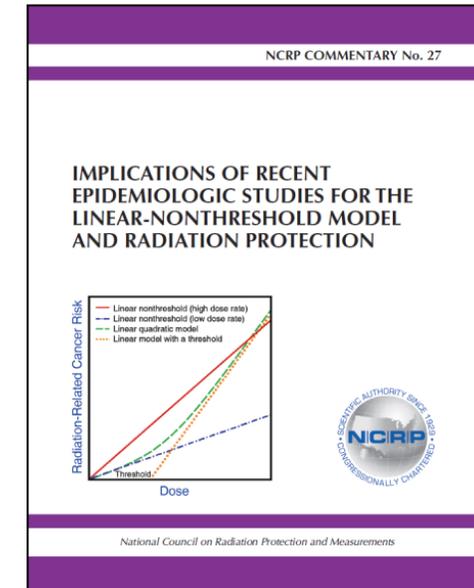

### Systematic application of quality criteria

- Epidemiology - Dosimetry – Modelling
- Composite score of specific strengths and weaknesses

### Overall evaluation of the support to LNT

- Most of the quantitative low dose-rate epidemiological data **broadly support a LNT model** for total solid cancer and leukemia.

➔ **The LNT model, perhaps with a DREF >1, is prudent and practical for radiation protection purposes**

**Risk of solid cancer in low dose-rate radiation epidemiological studies and the dose-rate effectiveness factor**

Roy Shore<sup>a</sup>, Linda Walsh<sup>b</sup>, Tamara Adenot<sup>a</sup> and Werner Rühm<sup>c</sup>

<sup>a</sup>Environmental Medicine, New York University School of Medicine, New York, USA; <sup>b</sup>Department of Physics, University of Zurich, Zurich, Switzerland; <sup>c</sup>Clinical Department, Institute for Radiation Protection, University of Applied Sciences, Osnabrück, Germany; <sup>d</sup>Department of Radiation Protection, Institute of Radiation Protection, Karlsruhe Institute of Technology, Karlsruhe, Germany

**ABSTRACT**  
Purpose: Epidemiological studies used for radiation protection purposes have been limited primarily to the Life Span Study (LSS) of atomic bomb survivors who received brief exposures at high dose rates, with very little dose information to enable regarding relative risk from low dose-rate (LDR) exposures to the same-energy-transfer (LET) radiation. We conducted a meta-analysis of LDR epidemiological studies that provide dose-response estimates of solid cancer risk in addition to information for corresponding LSS rates, in order to estimate a dose rate effectiveness factor (DERF).  
Materials and methods: We identified 21 LDR studies with dose-response risk estimates for solid cancer and corresponding LSS rates. The LDR study risk estimates were derived from the LSS risk estimates using matching values for sex, mean age at first exposure and attained age, targeted cancer types and accounting for type of diagnostic exposures. The ratio (DERF) of a rate of the excess relative risk per Gy (ERR/Gy) in the matching LSS ERR risk estimate (ERR/LSS) was calculated, and a meta-analysis of the risk ratios was conducted. The temporal of the incident risk rates presented an estimate of the DERF.  
Results: The meta-analysis showed a DERF risk ratio of 0.86 (95% confidence interval (CI) 0.14, 0.97) for the 10 deaths of solid cancer mortality and 0.13 (95% CI 0.10, 0.16) when three cohorts with long incidence data also were added, including a DERF with values around 1, but statistically compatible with 0, meaning the average were highly increased by the single cancer study. When the single study was excluded the DERF risk ratio increased to 1.17 (95% CI 0.80, 1.66) for mortality and 0.14 (95% CI 0.08, 0.21) for incidence, indicating a lower DERF in the group of 12 single studies. The meta-analysis also showed that the mean age at first exposure and attained age were 0.10 (CI 0.05, 0.16) for solid cancer mortality and 0.18 (95% CI 0.10, 0.26) for mortality incidence data.  
Conclusions: The incorporation of a broad exposure for a range of the DERF appears on the exposure status of including the Nagasaki study. This study indicates a range of uncertainty in the value of DERF between 1 and about 2 after protracted radiation exposure. The LSS data provide direct evidence regarding risk from estimates of the dose rate as an important component to the LSS risk estimates used for radiation protection purposes.

**Introduction**  
For many years, the primary basis for risk assessment in radiological protection has been the Life Span Study (LSS) cohort of Japanese atomic bomb survivors who received a radiation exposure at a high dose rate and in which study members with higher doses above several hundred mSv assigned elevated cancer rates have been influential in defining the LSS risk estimates. In contrast, most contemporary exposures to ionising radiation consist of protracted exposures at low dose rates (e.g. environmental or occupational exposures or numerous small exposures spread out over time (e.g. medical radiological examinations)). It is unclear whether cancer risks estimated from an acutely exposed population accurately predict risks in populations exposed to protracted ionising radiation.  
A variety of past experimental animal studies has suggested that low LET radiation delivered at a low rate or in many small dose fractions is less carcinogenic than the same total dose delivered at one acute exposure (Shore et al. 2015). This led to the definition of the dose rate effectiveness factor (DERF) for an acute exposure for several decades ago, regarded by the International Commission on Radiological Protection (ICRP) as a combined dose and dose rate effectiveness factor (DERF) of 2 (reviewed in Rühm et al. 2013a). That is, compared to the dose rate (LDR) radiation exposure, it regarded as causing about one half as many solid cancers in a comparable acute dose of radiation (i.e. a DERF of 2). More recently, the National Academy of Sciences National Research Council proposed a DERF value of about 1.5 in 2003 (NAS-NRC 2003), which was criticised shortly thereafter (Shore 2015), to now now consider that the DERF should even be about 1 and might therefore be unnecessary (Shore 2015). The historical development of our knowledge on

## MAIN POINTS

- This report evaluates the **current scientific evidence on low-dose and low-dose-rate biological effects of ionising radiation**, in terms of the low dose effectiveness factor (LDEF) and the dose rate effectiveness factor (DREF). The report reviews results on endpoints related to the risk of all solid cancer, at sub-cellular, cellular, tissue and organism, and population levels. In this report, low doses are those below 100 mGy, and low dose rates are those below 0.1 mGy min<sup>-1</sup> when averaged over about an hour, for low linear energy transfer (LET) exposures.

.....

- While **considerable uncertainties remain**, the ranges of LDEF and DREF values obtained here are narrower than those obtained in previous evaluations. The overall conclusion of this report is that, based on current scientific evidence, **LDEF and DREF values much larger than 3 or less than 1 are unlikely**. These ranges appear largely consistent for the various sources of data reviewed in this report.

### Abstract

During the first half of the 20th century, it was commonly assumed that radiation-induced health effects occur only when the dose exceeds a certain threshold. This idea was discarded for stochastic effects when more knowledge was gained about the mechanisms of radiation-induced cancer. Currently, a key tenet of the international system of

### The Linear No-Threshold Model in Epidemiological Studies: An Example of Radiation Exposure

Won Jin Lee\*

Department of Preventive Medicine, Korea University College of Medicine

**ABSTRACT**

The linear no-threshold (LNT) model is an assumption that explains the dose-response relationship for health risks, allowing for linear extrapolation from high doses to low doses without a threshold. The selection of an appropriate model for low-dose risk evaluation is a critical component in the risk assessment process

# Interpretation of the INWORK epidemiological study (Richardson et al. BMJ 2023)

Dear all

I would like to come back to our discussions about the [interpretation of the INWORK epidemiological study \(Richardson et al. BMJ 2023\)](#). This study has been evoked in my presentation on LNT during the MC meeting, during the ICRP symposium in session 17 “Effects & dose-response: cancer, circulatory disease, and beyond”, and in the Committee meetings, in C1 and in the C1-C2 join session.

The principal conclusion coming from INWORKS is that **the findings provide support to the Radiological Protection System**. Two main results of the INWORKS study are

- **There is an association between cancer risk and radiation exposure when exposure is protracted over a long period**
- **There is an association between cancer risk and radiation exposure even in the low dose range**

Currently, the radiation detriment calculation is based mainly on risk models derived from the Japanese atomic bomb survivor study (LSS). That study is surely a valuable source of information about the effects of ionising radiation, but that population was exposed acutely to radiation, and the survivors received low to high doses, at high dose rate.

**INWORKS demonstrates a positive association between radiation dose and cancer risk in a population that was exposed protractedly to radiation, and workers received low to moderate doses, cumulated at low dose rates.** This is indeed an important finding which provides a complement to our knowledge about the effects of radiation exposure derived from studies of populations exposed acutely. **These results are clearly in support of the current system of radiological protection.**

# Interpretation of the INWORK epidemiological study (Richardson et al. BMJ 2023)

When we consider the findings on the full INWORKS cohort, the results are very coherent with the risk estimates derived from the A-bomb survivor study (see Leuraud et al. REB 2021) for a detailed comparison of the results of the LSS and those of INWORKS). These results are of major interest in the discussion about DREF.

Of course, as most of the research studies, when you try to answer a scientific issue, you often raise other issues. This is the case in the recent INWORKS article, **in which some of the results raise questions about the estimate of the dose-risk relationship when restricting to low doses or when excluding early workers from the analysis.** These results need to be further investigated.

Finally, I would like to emphasize a point that seems fundamental to me, namely that **no epidemiological study should be considered in isolation.** Even if the LSS or INWORKS are clearly major studies in this field, **their results must be considered in the context of all the available data.** Thus, **suggesting that a single result could have a direct impact on regulatory aspects is a misinterpretation of the recently published INWORKS results.**

Best regards  
Dominique

# CANCER AMONG WORKERS: Conclusions

- Miner studies have provided strong evidence of excess lung cancer. Dose response quite linear.
- Worker studies provide evidence of association with broader group of solid cancers. Dose-response is quite linear.
- Excess attributable cases in worker studies are quite small, given the typical low dose distributions in these cohorts.

Large pooling studies provide statistical precision, and allow us to turn our focus towards questions of: **confounding, selection, and measurement error.**

Among 1000 workers\*

216 deaths - 64 by cancer or leukaemia

of which 1 attributable to exposure to ionizing radiation

- based on results from the INWORKS cohort : 308,297 workers, with mean dose 24 mSv and follow-up 27 years (i.e., age at end of follow-up 58 years).
