1 Introduction
01 Introduction

Piping and platform in the pools

- The Kijang research reactor pools have **limited space** for radioisotope production, neutron transmutation doping, and fast neutron flux utilization.

- In particular, previous designs required design change to **avoid interference between piping and platform in the pools**.

- The outline of the piping that falls down after passing through the pool penetration **shall not interfere with the pool platform**.

- In this study, the distance between the pool liner and the pipe outline is calculated, and the design modification ensures that **the piping with a nominal diameter of 2-1/2" or less does not interfere with the pool platform**.

Methods and Results
Methods and Results

Modified projection type penetration [1] and piping

- Originally, the penetration in the pool was a projection type.

\[ P = \text{projection length, mm} \]
\[ H = \text{head plate thickness, mm} \]
**Methods and Results**

» Modified non-projection type penetration [1] and piping [2]

- This figure shows modified pool liner penetration section and piping (non-projection type).

\[ L = \text{pipe length from head plate to elbow, mm} \]
\[ A = \text{elbow curvature, mm} \]
\[ D_o = \text{outside diameter of pipe, mm} \]
\[ T = \text{total length from pool liner to pipe outline, mm} \]
Non-projection type penetration

- To prevent interference with the pool platforms, *non-projection type penetrations* were applied for vertical pipings with a nominal diameter of 2-1/2" or less.

- The distance between the pool liner and the pipe outline (T) is reduced by the length of the previous projection (P), and the head plate of the pipe is welded directly to the embedded plate of the pool liner.

- Table I shows the calculated results of total length (T) with long radius elbows of 2 and 2-1/2" for *non-projection type penetration*.

NPS: Nominal Pipe Size  
LR: Long Radius (A = 1.5 NPS)
Methods and Results

Non-projection type penetration

- For pipings of 2" or less with non-projection type penetration, there are no interference with the pool platforms. However, 2-1/2" pipings require additional design change.
Methods and Results

» Short radius elbow

- Considering welding for 2-1/2" pipings including variable pipe length (L), it is not easy to avoid interference with the pool platforms.

- Because the total length (T) decreases as the elbow curvature (A) decreases, the elbows are changed from long radius to short radius for 2-1/2" pipings. Table II shows the calculated result of total length (T) with short radius elbow of 2-1/2".

<table>

<td>73.0</td>
<td>36.5</td>
<td>119.0 + L</td>
</tr>
</tbody>
</table>

SR: Short Radius (A = 1.0 NPS)

- For pipings of 2-1/2” with short radius elbow, there are no interference with the pool platforms.
Conclusions
Conclusions

- In this study, the total lengths from the pool liner to the pipe outline are calculated for some cases, and no interference was made through design modifications.

- The design changes include the application of non-projection type penetration and short radius elbow.

- This method can be expanded to other types of penetration and sizes of piping and it will be useful in the efficient use of limited space.
